

Congestion Sub-Series — Index (Unified Source-Only Archive)

Unified archive v100 (2026-02-24)

Scope. This note indexes the Congestion sub-series and records where “split supplement” content was absorbed into the unified source-only papers.

Imports. None; this file is purely navigational.

Exports. A three-paper reading order and a continuity pointer into the series-wide index (`../SERIES_INDEX.tex`).

Artifact policy. Source-only; plots and regression vectors referenced by the papers are available on request.

What this sub-series contains

The congestion sub-series is a three-paper pipeline: Former split supplements are integrated into the main papers as short appendices/sections (source-only; plots on request); see `../SERIES_INDEX.tex` for the continuity map.

- **Congestion-EQ** (`paper1\_congestion\_eq/paper.tex`): a TV-tier contract and accounting rules for congestion witnesses (RTT, queueing delay, loss/ECN marks).
- **PSC-Q** (`paper2\_psc\_q/paper.tex`): mechanism families (public service calendars + slack-harvesting substitution padding) for meeting Congestion-EQ budgets in compiler-friendly systems.
- **W-Congestion-EQ** (`paper3\_w\_congestion\_eq/paper.tex`): verifiability (receipt fields, verifier checks, and transparency anchoring) for published congestion-budget claims.

Notes on tightness and “supplement” material

The historical split archive shipped separate “supplement” PDFs with additional plots and regression vectors. In this unified archive, we keep a *single-file* rule: each paper is one `.tex` file. Operator-facing microstudies and regression-vector descriptions are preserved as brief appendices/sections inside the three main papers; large plots, scripts, and JSON evidence remain available on request as an external artifact bundle.
