

Artifact and Disclosure Policy for the One-True-Archive (Source-Only Public Release)

Unified archive note v0.01 (2026-02-27; archive v100)

Abstract

This archive is designed for short, referee-grade papers that remain readable and checkable without shipping a large companion repository. Accordingly, the public release is *source-only* (one `.tex` file per paper), while artifacts that are useful for deeper auditing (e.g., scripts, logs, simulations, certificates/keys, measurement traces, and raw data) are distributed on request. This micro-note standardizes the disclosure language used throughout the series and clarifies what is available, under what conditions, and how it is indexed.

Scope. Define the disclosure contract for this source-only public release: what is shipped publicly, what is held back, and how on-request artifacts are indexed to the public papers. This is intentionally a one-paragraph policy note plus canonical boilerplate, kept standalone for citation convenience.

Imports. None.

Exports. Canonical boilerplate and a manifest-indexing rule used by every paper in this archive when referring to artifacts, tooling, certificates, or raw evidence; the note is intentionally a micro-note rather than a full technical paper.

Artifact policy. This note *is* the artifact policy; it is the canonical citation target [1].

1 Policy statement (canonical)

Public release. The public archive contains only referee-facing `LATEX` sources (one file per paper) plus a manifest of file hashes. When a paper refers to paths such as `tools/`, `scripts/`, `evidence/`, or `certs/`, these refer to an *artifact bundle* that is not included in the public release.

On-request artifacts. On request, we can provide an archive containing the referenced artifacts, including (as applicable): (i) build scripts and dependency locks; (ii) raw and processed data; (iii) simulation code and seeds; (iv) evaluation harnesses; (v) certificates/keys for proof-carrying plans and logs; (vi) transparency-log checkpoints and witnesses; and (vii) any auxiliary notes needed to reproduce plots or tables.

Disclosure control. Each paper may state additional disclosure constraints (e.g., what portions of logs or measurements can be shared publicly). Absent an explicit restriction, artifacts are available to referees/auditors under a standard confidentiality assumption.

Indexing. The artifact bundle is indexed to this public release by the SHA256 manifest included at the archive root.

2 Recommended boilerplate (non-redundant)

Papers in this archive may include the following short paragraph:

Artifact policy. This archive is source-only; supporting artifacts are available on request.
See [1].
